

# WA-SOL®

## Water-in-Oil Reagent Composition Kit

By developing the new test reagent WA-SOL®, Martechnic® achieved a breakthrough in the Test Reagent area. WA-SOL® is the next generation of reagents for testing water in oil and is **NOT CLASSIFIED AS DANGEROUS GOOD FOR TRANSPORT**.

The reagent is compatible with all water in oil test devices from Martechnic® and reduces enormous delivery costs.

### One WA-SOL® Reagent Composition Kit contains:

- One bottle “WA-SOL® Basic”
- One bottle “WA-SOL® Activator”
- Stirring hook
- MSDS and instructions

WA-SOL® Basic and WA-SOL® Activator are mixed per ratio 1:1 with a stirring hook for example with a drilling machine. The components are not available separately but as “Composition Kit” only.

“WA-SOL® Basic” contains calcium hydride, which is enclosed in a special material. This material prevents the contact between calcium hydride and water.

Once arrived at its final destination, “WA-SOL® Activator” and “WA-SOL® Basic” get mixed to a ready-for-test mixture.

If WA-SOL® is ready after mixing the components it can be used for all test devices from Martechnic®, like WIO Solution or WT05 Solution.
